

Part 1

Part 1: Evaluation of Project 2

[Figma Design Link](#)

Contributions:

Shayla / Participant 1:

- Document formatting, Interview Questions
- Part 1 and 3 Interview, Transcribing, Analyzing, Reporting
- Cognitive Walkthrough / SUS
- Part 1 and 3 SME reflection
- Recommendations for re-design intervention
- Helped Syahirah with final touches on final Figma prototype

Syahirah / Participant 2:

- Part 1 and 3 Interview, Transcribing, Analyzing, Reporting
- Cognitive Walkthrough / SUS
- Part 1 and 3 SME reflection
- Recommendations for re-design intervention
- Part 2 majorly designing on Figma and documentation

Kayla / Participant 3:

- Part 1 and 3 Interview, Transcribing, Analyzing, Reporting
- Cognitive Walkthrough / SUS

User Recruitment

Participant 1: Friend, potential user, fits target demographic

Participant 2: Friend, familiar with virtual try-on systems and tech feasibility

Participant 3: Co-worker, college student, potential user

Interviews

Stage 1: Thematizing

Research Goals: to understand user perceptions, identify usability issues, and gather feedback on the previous project prototype

Method: semi-structured interview with estimate of 30 minutes per participant

Setting: quite private room with laptop for prototype interaction

Materials:

1. High-fidelity Figma prototype
2. Pre-written interview questions
3. Audio recording
4. SUS questionnaire

Stage 2: Designing Research Protocol

Introduction Script:

Hello, we just wanted to thank you for taking the time to complete this interview with us today. We want to let you know that all of your information will be confidential and anonymous. Before we get into things we also want to confirm that it is okay that this interview is audio recorded for the intent of gathering notes and reviewing accurate information given from you after. If at any point you wish to leave the interview you may and feel free to ask any questions along the process. To brief you on the topic at hand before we jump right into it, today we are hoping to understand your experience with our high-fidelity design on Figma.

Interview Questions:

1. Can you walk me through what you expect to happen when you click the "Virtual Try On" button?

2. How easy or difficult was it for you to upload your image and choose a size and color? What, if anything, felt confusing or unclear?
3. Would this virtual try on experience help you feel more confident about choosing a size or purchasing this item? Why or why not?
4. If you could change one thing about this virtual try-on process, what would it be and why?
5. How comfortable do you feel uploading a full-body photo of yourself into a shopping app? What would make you feel more secure?

Conclusion Script:

That wraps up the questions we have today and we want to thank you for your time and valuable feedback. We are conducting these interviews in hopes of improving the user experience of the American Eagle shopping platform and exploring more potential ideas and improvements. If you have any questions, please feel free to ask and if you need to reach out to us for any reason you can contact us via email.

Stage 3: Interview

We conducted interviews one-by-one based on the designed guide and each session followed the designed protocol with flexibility for follow-up questions based on participants' responses.

Stage 4: Transcribing, Stage 5: Analyzing, Stage 6: Verifying, Stage 7: Reporting

(Under "P1 Participant 1, 2, 3 Interview" tabs)

Observation study & Cognitive Walkthrough

Observation study (us watching the user interact with our model):

Participant 1:

- Participant navigated through the interface well.
- They understood each aspect, such as color and size adjustments, clicking the virtual try on button, clicking to upload an image, and exiting out of the virtual try on to go back to the main page.
- There were some pauses due to imperfections from the figma model.

Participant 2:

- The participant quickly located the “Virtual Try On” button without assistance.
- The participant used the dropdown and buttons without confusion.
- The participant paused for 3–4 seconds before uploading and verbally said “I hope they don’t save this photo.”
- The observation highlights strong usability with minor friction points related to privacy reassurance, automation expectations, and result clarity.

Participant 3:

- Participant needed little assistance or help navigating the prototype.
- Participant understood drop downs and selections well and navigated to uploading an image quickly.
- Participant was hesitant to select and upload image and was probably the longest time spend was choosing a photo.
- Interview and observation some good additional minor tweaks but overall the user seemed to have little trouble at all

Cognitive Walkthrough (based on specific task given to user):

Subtask	Cognitive Walkthrough Q.1 Is the user on the right track and action inline with an existing “mental model”? Is the effect of the action the same as the user’s goal?	Cognitive Walkthrough Q.2 Is the “action visible” (perceivable and operable)?	Cognitive Walkthrough Q.3 Is “recognition” of “correct action” readily present and visible in the task, by means of signifiers, labels, icons, communication, etc.?	Cognitive Walkthrough Q.4 Is “feedback” present and is the user “understanding the feedback” such as confirmations, errors, warnings, etc.?
Participant 1	Yes	Yes	Yes	Yes
Participant 2	Yes	Yes	Yes	Yes
Participant 3	Yes	Yes	Yes	Yes

Administer SUS:

Participant 1:

System Usability Scale Questionnaire		Strongly Disagree						Strongly Agree
1.	I think that I would like to use this product frequently.	1	2	3	4	5		
2.	I found the product unnecessarily complex.	1	2	3	4	5		
3.	I thought the product was easy to use.	1	2	3	4	5		
4.	I think that I would need the support of a technical person to be able to use this product.	1	2	3	4	5		
5.	I found the various functions in the product were well integrated.	1	2	3	4	5		
6.	I thought there was too much inconsistency in this product.	1	2	3	4	5		
7.	I imagine that most people would learn to use this product very quickly.	1	2	3	4	5		
8.	I found the product very awkward to use.	1	2	3	4	5		
9.	I felt very confident using the product.	1	2	3	4	5		
10.	I needed to learn a lot of things before I could get going with this product.	1	2	3	4	5		

Figure 1: SUS responses by participant 1

Participant 2:

System Usability Scale Questionnaire		Strongly Disagree						Strongly Agree
1.	I think that I would like to use this product frequently.	1	2	3	4	5		
2.	I found the product unnecessarily complex.	1	2	3	4	5		
3.	I thought the product was easy to use.	1	2	3	4	5		
4.	I think that I would need the support of a technical person to be able to use this product.	1	2	3	4	5		
5.	I found the various functions in the product were well integrated.	1	2	3	4	5		
6.	I thought there was too much inconsistency in this product.	1	2	3	4	5		
7.	I imagine that most people would learn to use this product very quickly.	1	2	3	4	5		
8.	I found the product very awkward to use.	1	2	3	4	5		
9.	I felt very confident using the product.	1	2	3	4	5		
10.	I needed to learn a lot of things before I could get going with this product.	1	2	3	4	5		

Figure 2: SUS responses by participant 2

Participant 1 SUS score = 95/100, reflecting exceptionally high user satisfaction

Participant 2 SUS score = 75/100, which is above average usability.

Participant 3:

The System Usability Scale Standard Version		Strongly Disagree						Strongly Agree
		1	2	3	4	5		
1	I think that I would like to use this system frequently.	☐	☐	☒	☐	☐		
2	I found the system unnecessarily complex.	☒	☐	☐	☐	☐

Figure 3: SUS responses by participant 3

Participant 3 SUS score = 85/100, reflecting above average user satisfaction.

Objective analysis and review of project 2 using: UX Heuristics + 13 Principles of Display Design

Nielsen's 10 Usability Heuristics:

1. Visibility of system status:
 - Upload confirmation status indicator informs users photo was received
 - Product name consistently displayed in header across all screens
 - Visual distinction between enabled or disabled button
2. Match between system and the real world:
 - All icon like upload icon, shopping cart universally recognized
 - Uses standard clothing sizes
 - Descriptive names for color instead of hex codes
3. User control and freedom:
 - Users have the control over which photo they upload and their selection of the size and color they want to try on for each item.
 - Not much freedom in switching items without going back to the main shop page.
4. Consistency and standards:
 - The design of our add-on remains consistent with the color scheme and design of the clothing app/website the user is shopping on which allows it to be intricated well.
5. Error prevention:
 - You can go back and change size and color
 - "Try Again" button routes user back to the virtual try-on page to try another combination of size/color
 - We do not currently have a feature that evaluates the image the user provides to let them know if the image they provide follows the image requirements/guidelines
6. Recognition rather than recall:
 - Product name or image visible throughout the flow
 - Visual representation and not just names for easier recognition
 - Every button describes its action
7. Flexibility and efficiency of use:
 - Can access virtual try-on from product page
 - Dropdown selection is faster than typing for size or color
 - No batch try-on like can't add multiple items to virtual try-on feature
 - After reviewing result, must restart to try different product

8. Aesthetic and minimalist design:

- Our design keeps it simple and only has relevant helpful information on the screen to make the process smoother.

9. Help users recognize, diagnose, and recover from errors:

- Users are able to access the try again button, which allows them to travel easily between the steps and redo.

10. Help and documentation:

- Photo guidelines available when needed
- Provide privacy details
- Instructions focus on what user needs to do, not the technical details
- No FAQ section or help center link

13 Principles of Design Display:

1. Make display legible/audible:

- Fonts are easy to see and clearly legible. Easy to read size and color.

2. Avoid absolute judgment limits:

- Few colors that are chosen to make things simpler. For example, when a user selects a drop down, the rest of the screen that is no longer useful becomes slightly greyed out.

3. Top-down processing

- Every page follows top-down processing, with all final-action buttons positioned at the bottom after user has chosen desired color and size
- Back arrows and like/heart sections are at the top, following the average consumer website/app model

4. Redundancy gain

- Heart icons symbolizes liking or favoring an item
- Arrows pointing to the left signal navigating back to a previous page
- Upload icon is consistent with uploading icons on most all other sites

5. Discriminability. Similarity causes confusion: use discriminable elements:

- All information is relevant, unique and useful.

6. Principle of pictorial realism

- Real, accurate image of product is displayed
- Image of product has depth cues such as shadowing, perspective, lighting, and texturing to indicate it is photorealistic

7. Principle of moving part

- Quantity section displays “+” on right side, consistent with the mental model that right represents a positive value
- Quantity section displays “-” on left side, consistent with the mental model that left represents a negative value
- Arrows pointing to the left signal navigating back to a previous page

8. Minimizing information access cost

- Reducing number of steps users must take to find what they need
- Reducing unnecessary clicks or buttons

9. Proximity compatibility principle

- The interface match with the user’s expectations based on their experience with the other systems
- Configuring in patterns
- Common hue of buttons

10. Principle of multiple resources

- Visual through image and icons
- Touch/tactile through tapping of buttons

11. Replace memory with visual information: knowledge in the world

- Navigation is intuitive, the user does not need to retain important info in working or long-term memory. Our interface can be used without any prior knowledge of the layout

12. Principle of predictive aiding

- The word “Add to bag” is distinctive that users know they’re not directly purchase the item
- The design leverages user behavior patterns to predict and highlight shortcuts or next steps

13. Principle of consistency

- Same header structure, fonts, button styling
- There is mixed input methods (dropdown and button grid) which creates slight cognitive friction

Summarize all insights from previous steps into a list of recommendations for a re-design intervention

Upload image or take photo

- Add in a feature that allows the user to take an image, rather than only allowing them to upload one from their photo gallery
- Auto-detect whether the photo meets requirements (good lighting, full body, background) before submission.

“as I have the photo, it would be nice to be able to like see different colors. Like it would have the color options and I could click. So I wouldn’t have to keep on redoing the process”

- Make it so that the user can immediately change the color and size on the AI result page, rather than going back to redo the process over again
- Offer recommended size based on the photo (e.g., “Most similar shoppers wear size M”)

Photo Guidelines Presentation

- Replace bullet text with an illustrated step-by-step guide.
- Include an example “good photo” vs “bad photo.”
- Show the guidelines *before* the upload screen instead of after confusion happens.

Increase Transparency & User Trust

- Provide a clear message such as “Your photo will be deleted after processing” if applicable.
- Provide explicit reassurance that the photo is not stored or shared unless necessary.

P1 Participant 1 Interview

P1 Participant 1 Interview:

Shayla

Can you walk me through what you expect to happen when you click the virtual try-on button? Like, you don't actually have to click it, but imagine clicking it. What would you expect to happen?

Interviewee

I would expect it to either ask for a like mirror photo of me or a very clear photo of my full body. I would expect it to ask for which color I want, which colored sweater I want, and I can like change the colors as I'm looking at the sweater on there. I would assume it would ask for my size. Yeah.

Shayla

Yeah. How easy or difficult was it for you to upload your image and choose the size and color? What if anything felt confusing or unclear? So imagine as if... Imagine, yeah. We can actually get it to that. But, like, if you did, and it was, like, normal, you know, and you click it, and then it's, like, that little thing shows up on your iPhone, and then you add a photo, would it be easy or difficult?

Interviewee

I think it'd be pretty easy. I would just have to... I think it would be nice if I could, like, if it... Does it have an option of, like, take a photo or upload a photo? Because if it would take a photo, that would be easier, because if I don't have a photo of, like, my whole body... Yeah. Then I could just go up to a mirror and, like, take a snapshot really quick.

Shayla

Yeah. That makes sense. We did not think of that. Write that down! Write that down! What about, like, the size and color? Did it seem...

Interviewee

Yeah, it's easy. Straightforward.

Shayla

Cool, cool, cool, cool. Um... Would this virtual try-on experience help you feel more confident about choosing a size or purchasing this item? Why or why not? Like, would you, if this was an actual thing you could do, like, because we based this off of American Eagle, like their app. So if you could actually go to American Eagle and they had a virtual try-on button like ours, would that help you feel more confident about choosing what size you'd want to order? for, like, buying it online instead of going in person.

Interviewee

Yes.

Shayla

Because you'd be able to, like, see it on your body. But then again, because the thing about it is AI isn't always, like, accurate.

Interviewee

A little bit, but not, like, fully. Because, you know, you're only really viewing it from, like, front angles. And I feel like if you took, like, a side photo of yourself, it wouldn't be able to show what it looks like.

Shayla

Yeah.

Interviewee

Does that make sense?

Shayla

Mm-hmm. If you could change one thing about this virtual trend process, what would it be and why? Or like if you wanted to add anything to it.

Interviewee

Um...No, maybe... like what I said like I could just walk up and it could say upload or take image

Shayla

like after you click the image button like that, yeah

Interviewee

like that and it could be, like it could be, like, upload image or take photo you know but I think size, color, yeah... I mean there's not really any plus that I would like want.

I think like maybe as I have the photo, it would be nice to be able to like see different colors.

Like it would have the color options and I could click. So I wouldn't have to keep on redoing the process.

Shayla

Oh, instead of going back? Okay.

Interviewee

Yeah. Or like if I'm like, oh, that's too big. That size is too big on me. You can adjust it.

Shayla

Okay, that makes sense. Having like a submit button there. Okay. The last question. This is so fast, actually. I feel like I need to ask you follow-up questions, but you're very thorough with your responses. How comfortable do you feel uploading a full-body photo of yourself into a shopping app? What would make you feel more secure? Because you're not, like, naked or anything.

Interviewee

I'm not like taking a picture in my bra.

Shayla

Some people might do that, though. I don't actually remember. You just need to have tight clothing, it says. So it can see your body.

Interviewee

Right. So it can, like, fit to your body. Mm-hmm. I don't know. I guess I wouldn't, like, I wouldn't upload, like, a naked photo. Mm-hmm. But, I mean, the photo guidelines tell you what you need to do. So. Yeah. You know?

Shayla

Yeah, I think that's it.

Report/Findings:

The user wants the option to either upload a photo OR take to actively take a photo for the Virtual Try-On. They pointed out that AI Virtual Try-On would most likely not get an accurate result from a side view, meaning the side-view of the clothing item would not be available for the user to see. It would be beneficial, based on this person's feedback, to let the user change the color and size on the "AI results" page, and then add a "Try Again" button, rather than having them go to the previous page to redo the process. Otherwise, this user found the other aspects of our prototype satisfactory.

P1 Participant 2 Interview

P1 Participant 2 Interview:

1. Can you walk me through what you expect to happen when you click the “Virtual Try On” button?

Interviewee: “Yeah, so when I click the ‘Virtual Try On’ button, I expect it to take me to a screen where I can upload a photo of myself. And then probably choose what size or color I want to preview. The screens you have match pretty well with what I would expect.”

2. How easy or difficult was it for you to upload your image and choose a size and color? What felt confusing or unclear?

Interviewee: “It was actually pretty straightforward. The big upload icon is clear. The dropdowns for size and color also make sense. The only slightly confusing part is that the size and color selection pop-up looks almost identical to the size selector on the product page. Like, it feels repetitive. I wasn’t sure if I needed to pick the size again even if I already selected it earlier. But overall, I’d say the process is intuitive.”

3. Would this virtual try-on experience help you feel more confident about choosing a size or purchasing this item? Why or why not?

Interviewee: “Yeah, it would help a bit. Seeing how the color or the fit looks on a body similar to mine is nice. So it boosts confidence about color and vibe, but maybe not the exact size. If it actually overlaid the clothes on my real uploaded photo, then I’d trust it more.”

4. If you could change one thing about this virtual try-on process, what would it be and why?

Interviewee: “Hmm, I’d probably add clearer feedback after uploading the photo. Like a preview of the photo I uploaded before clicking ‘Submit.’ Also, maybe add a loading indicator during the processing step so the user knows something is happening. The design shows a spinner, which is good, but maybe a text like ‘Generating your look’ would feel more reassuring.”

5. How comfortable do you feel uploading a full-body photo of yourself into a shopping app? What would make you feel more secure?

Interviewee: “Honestly, a bit uncomfortable. Full-body photos feel personal, and I’d worry about where they’re stored. What would make me feel more secure is like a clear

message saying the photo is temporary and automatically deleted after processing or maybe a label that the image processing is done locally or securely encrypted.

Report/Findings:

Participant 2 expected the Virtual Try-On flow to open a new screen allowing them to upload a personal photo and provide options to select size and color the item they want to preview. They stated that the screens shown in the prototype match their expectations, indicating good alignment between user mental models and intended flow. They also said this eventually increases buyer confidence but trust in size accuracy remains limited. They recommended two primary enhancements: improved loading feedback and clear message regarding security concerns.

P1 Participant 3 Interview

P1 Participant 3 Interview:

Kayla: Hello, we just wanted to thank you for taking the time to complete this interview with us today. We want to let you know that all of your information will be confidential and anonymous. Before we get into things, we also want to confirm that it is okay that this interview is audio recorded for the intent of gathering notes and reviewing accurate information given from you after. If at any point you wish to leave the interview, you may, and feel free to ask any questions along the process. To brief you on the topic at hand before we jump right into it, today we are hoping to understand your experience with our high-fidelity design on Figma.

Interviewee: Yes, that's totally fine. I'm ready.

Kayla: So to start off, imagine you're clicking the "Virtual Try On" button. Can you walk me through what you expect to happen when you click the "Virtual Try On" button?

Interviewee: I would expect it to bring me to a screen where I can upload a picture of myself, probably a full-body photo. I'd also expect it to let me pick the size and the color I want to preview. Basically, I'd think it would walk me through the steps pretty clearly, like upload then choose size and color then generate. Something like that.

Kayla: How easy or difficult was it for you to upload your image and choose a size and color? What felt confusing or unclear?

Interviewee: Honestly, pretty easy. If it gave me the option to *either* upload a photo I already have *or* take a new photo, that would be ideal. Sometimes I don't already have a full-body photo saved, so being able to just take one in the moment would make things quicker.

Kayla: Yeah, that makes sense. We actually didn't think about the option to "take a photo" versus needing to upload one only!

Interviewee: Yeah! And for the size and color selection, it looked pretty straightforward. The only thing that threw me off a little was how similar the size selection looked to the size selector on the product page. It made me wonder if I needed to pick it twice. But overall, it wasn't confusing.

Kayla: If this were a real feature on American Eagle's app, do you think it would help you feel more confident choosing a size or buying something online?

Interviewee: Yeah, it would help somewhat. Mainly with seeing the color and the general fit. If it actually showed the clothes on *my* body, like overlaid on my uploaded photo, then I'd trust it even more. I think I'd feel more confident, but maybe not 100% because AI sizing can be hit or miss. But it would definitely help me more than just guessing.

Kayla: If you could change or add one thing to the virtual try-on flow, what would it be?

Interviewee: Probably a clearer preview of the photo I uploaded just like a little thumbnail or confirmation that I chose the right picture before I hit "Submit." And maybe a short message during loading, like "Generating your try-on..." so I know it's actually processing and didn't freeze. Also, I'd love it if I could switch between colors and sizes *without* restarting the whole process. Like once my photo is loaded, I should be able to just click different colors or sizes instantly.

Kayla: Yeah, that makes a lot of sense. Last question, how comfortable do you feel uploading a full-body photo into a shopping app? And what would make you feel more secure?

Interviewee: I'd be somewhat hesitant. Full-body photos feel personal, and I'd want to know exactly what the app is doing with it. I'd feel more secure if it clearly said the photo gets deleted immediately after processing or that it's encrypted and not stored anywhere. Like a little message explaining the privacy part would help a lot.

Kayla: That's an amazing feature to add thank you for that input! That wraps up the questions we have today, and we want to thank you for your time and valuable feedback. We are conducting these interviews in hopes of improving the user experience of the American Eagle shopping platform and exploring more potential ideas and improvements. If you have any questions, please feel free to ask, and if you need to reach out to us for any reason, you can contact us via email.

Interviewee: Sounds good. Thank you!

Report/Findings:

The participant understood the purpose of the session and felt comfortable proceeding with the interview. They appreciated the overall clarity and flow of the Virtual Try-On (VTO) experience shown in the high-fidelity design.

The participant expected the VTO button to lead them through a clear, guided flow beginning with uploading a full-body photo, followed by selecting size and color. They reported that the upload and selection steps were generally easy, though they suggested adding an option to take a photo directly rather than only uploading an existing one.

The participant found the size and color selection intuitive but mentioned slight confusion due to the size selector looking too similar to the regular product page, which briefly made them question whether they needed to choose a size twice. Despite this, the participant felt the process remained understandable.

Regarding usefulness, the participant said the feature would increase their confidence when choosing a size or purchasing online, especially if the system could realistically overlay clothing on their body photo. They noted that while AI-based sizing isn't always perfect, the added visualization would still improve their decision-making compared to guessing.

The participant suggested several improvements: adding a thumbnail or confirmation of the uploaded photo, including a loading message during processing, and allowing users to switch between colors and sizes after the initial upload without restarting the flow.

In terms of privacy, the participant expressed some hesitation about uploading a full-body photo. Their comfort would increase if the app clearly communicated how the photo was handled and reassurance that images are encrypted, not stored, or deleted immediately after processing.

Overall, the participant responded positively to the design and offered actionable suggestions for improving usability, clarity, and privacy transparency.

Part 2

Part 2: Re-design & Re-implementation

Prompts for Figma Make/AI

Enhanced Photo Guidelines

1. Create a new "Photo Guidelines" modal/screen that appears BEFORE upload
2. Use simple line drawings or minimalist illustrations
3. Good example: Green checkmark, light green tint
4. Bad example: Red X, light red tint
5. Clear visual contrast between do's and don'ts
6. 2-3 good examples, 2-3 bad examples maximum

When to Show:

- Automatically appears after clicking "Take Photo" or "Upload Photo"
- Can be dismissed with "I'm Ready" or X button
- Has "Don't show again" checkbox at bottom for returning users

Enhanced Privacy Consent

Goals:

- Cut text by ~50% while staying legally compliant
- Use visual trust cues (icons, badges, illustrations)
- Make privacy reassurance the main message
- Simplify checkboxes
- Add progressive disclosure (short now, details available)
- Friendly, human tone, avoid legalese

"Your Privacy is Protected"

- Lock icon 32×32px, blue
- Montserrat Bold 24px, centered
- Purpose: Immediate privacy reassurance

Visual Trust Element

- Illustration (200×160px): device + photo + lock/shield + checkmark
- Colors: blues/greens

"What Happens to Your Photo"

- Headline: Montserrat SemiBold 16px

- Bullets (4–5 max):
- ✓ icon (green), Inter 14px
- Clear, non-legal language

Required text changes:

- “Used only to show you how clothes look on you”
- “Deleted automatically after 30 days”
- Consent Checkboxes
- Headline: “To continue, please confirm:”
 1. ☐ I’m 18+ and this is my photo
 2. ☐ I agree to the Terms of Use and Privacy Policy
 - Links underlined, blue

Checkbox styling:

- 20×20px, blue when checked
- Hover: light blue border
- Focus: blue outline
- Checked: white checkmark on blue

“Learn More” Link

- “Learn More About Privacy” with icon

Primary CTA Button

“I Understand & Agree”

- Black background, white text
- Montserrat SemiBold 16px
- 52px height, pill shape
- Disabled until both checkboxes checked
- Subtle hover/active animations

Redesign Virtual Try-On Upload Photo

Redesign the “Virtual Try On – Image Upload” section with the following updates:

1. Add dual options for image input:
 - A prominent button labeled “Upload Photo” (from gallery)
 - A second button labeled “Take Photo” with a camera icon
 - Display the two buttons side-by-side or stacked with equal emphasis
 - Keep the current clean, minimal brand style
2. Add an auto-detection requirements module:
 - After a user selects/takes a photo, show an automatic analysis summary
Include detection indicators for:
 - Good lighting (check or warning icon)
 - Full body visible (check or warning icon)
 - Clear background / uncluttered (check or warning icon)
 - Use a neutral card-style layout with subtle borders and icons
 - If requirements are not met, show a small message:
“Your photo may not meet the recommended guidelines for accurate virtual try-on.”
3. Maintain current layout elements:
 - Keep the product title, header, arrow upload illustration (you can replace it with a more generic camera/upload graphic if needed)
 - Keep the size and color dropdowns
 - Keep the “Submit” CTA but move it below the auto-detection results
4. General style direction:
 - Clean, minimal, modern aesthetics
 - Neutral palette with black/white/gray
 - Rounded components to match existing UI
 - Consistent spacing and alignment with the current screen

Goal: Create a screen that clearly guides the user to either upload or take a photo, validates the image quality automatically, and preserves the simplicity of the original design.

Updated Virtual Try-On Result Page

Redesign the Virtual Try On result screen with the following improvements:

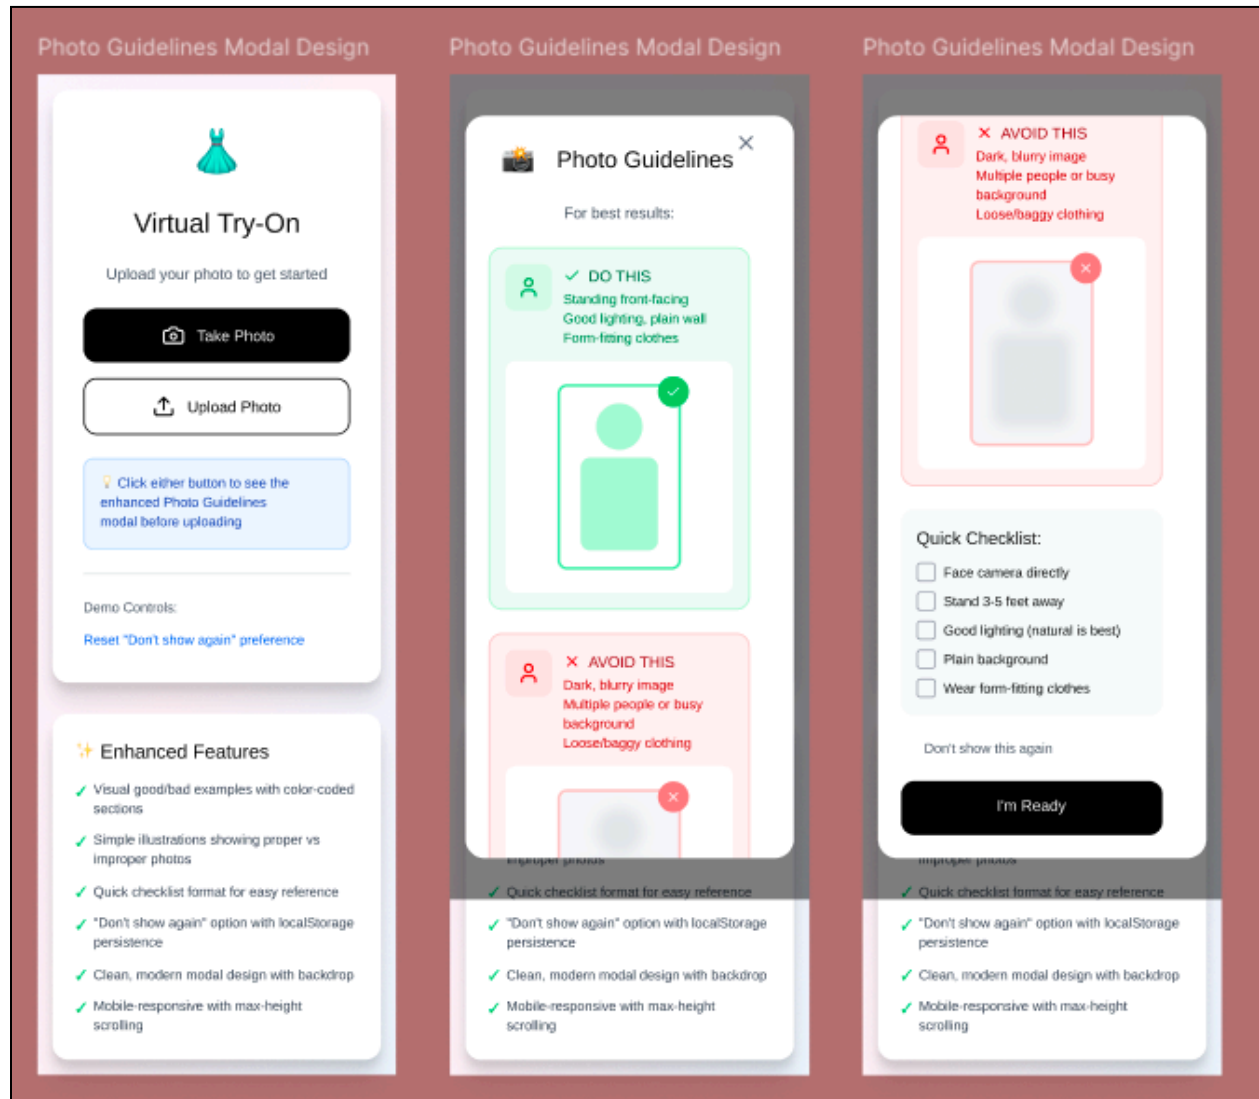

1. Add interactive size and color selectors directly on the result page:
 - Below the generated AI try-on image, add two selectors:
 - Size Selector: pill-style or dropdown with options (XXS–XXL)
 - Color Selector: color swatches with labels
 - When a user taps a new size or color, the AI result refreshes without navigating backwards
 - Keep the UI clean and consistent with the existing aesthetic
Ensure the selectors feel secondary to the AI image but still easily accessible
2. Surface a recommended size:
 - Add a small recommendation line above or within the size selector
 - Example text:
"Recommended size: M — Based on similar shoppers"
Keep the tone helpful and non-intrusive
 - Use a subtle icon (e.g., sparkle or info icon)
3. Rework the lower action section:
 - Keep Try Again and Download buttons
Make them appear below the size + color controls
 - "Try Again" should now refresh the AI with the selected size/color, not restart from the beginning
4. General style direction:
 - Match existing spacing, typography, and rounded shapes
 - Ensure the AI-rendered image remains the main visual focus
 - Maintain accessibility (legible labels, sufficient contrast)
5. Optional enhancement (if desired):
 - Add a micro-loading spinner overlay when switching size or color (small, centered, non-blocking)

Goal: Redesign the Virtual Try-On result page so users can easily change color and size without restarting the entire process, and display a recommended size based on their uploaded photo.

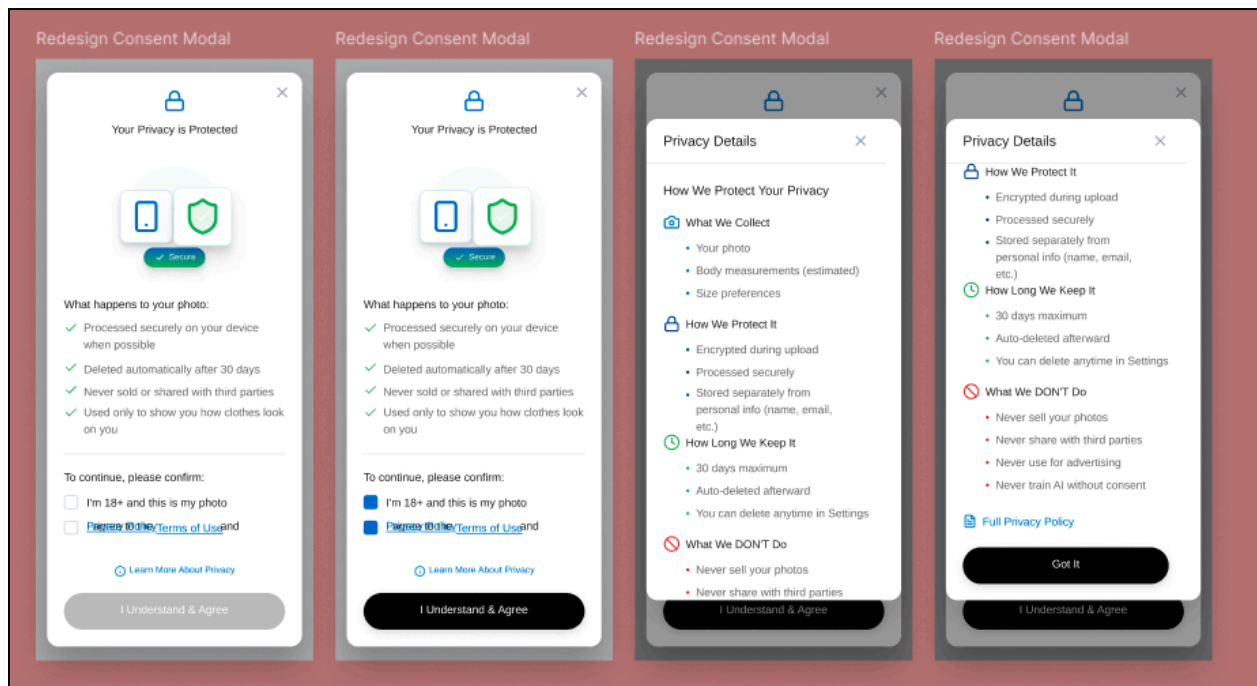

Outcome: A refined result page where users can instantly explore different sizes and colors without re-uploading their image, along with a subtle size recommendation based on their photo.

Figma Make/AI Results

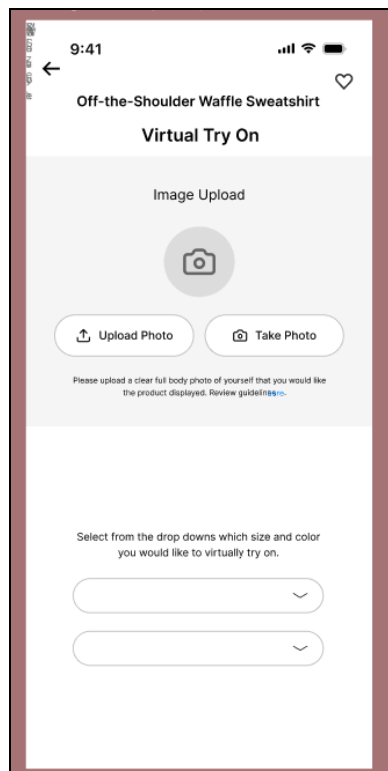

Result 1: Enhanced Photo Guidelines

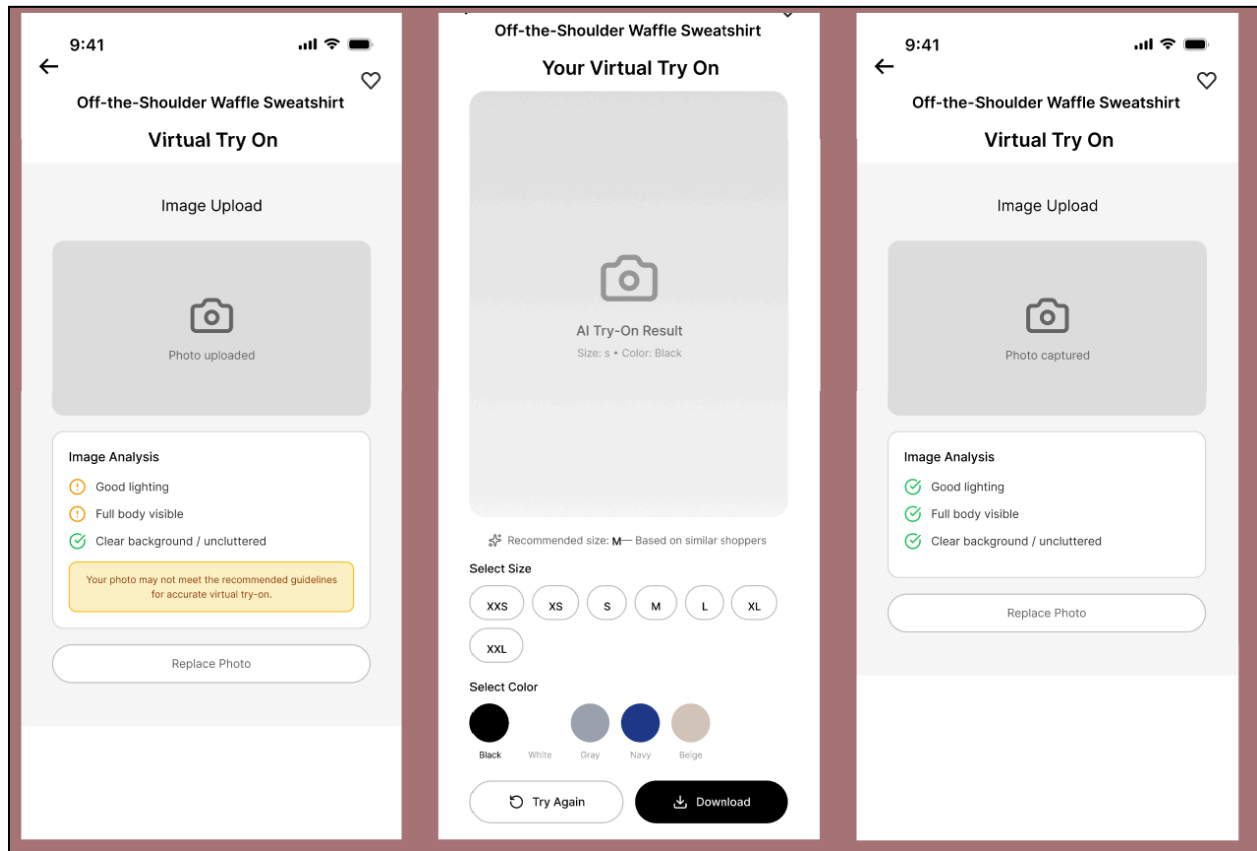

Result 2: Enhanced Privacy Consent

Result 3: Redesign Virtual Try-On Upload Photo

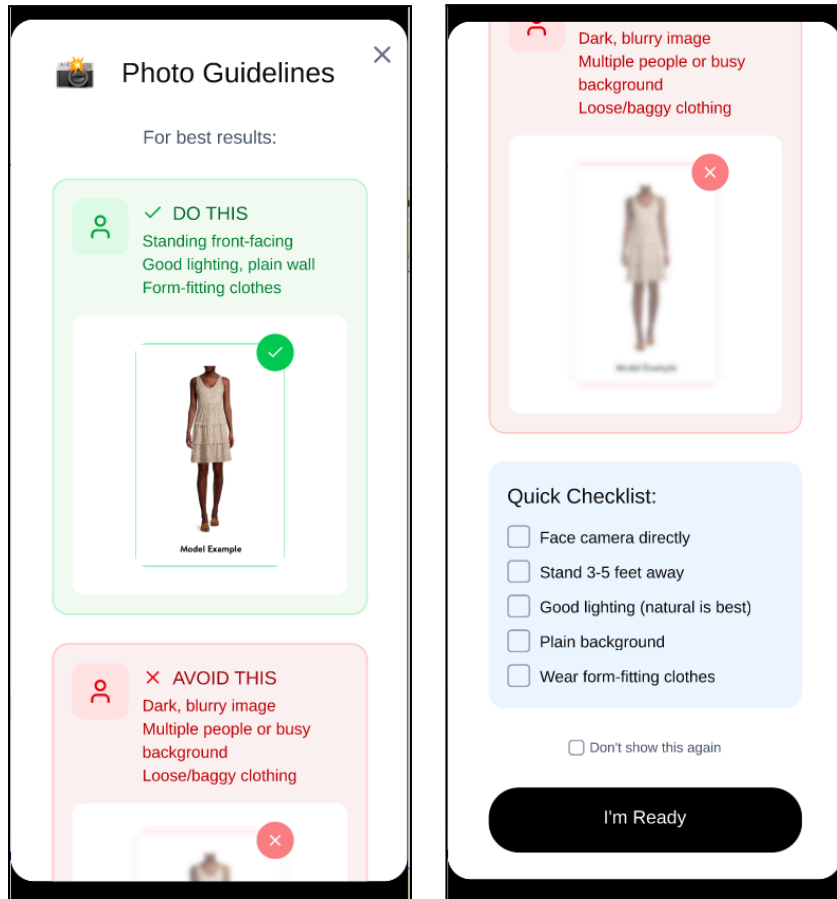

Result 4: Updated Virtual Try-On Result Page

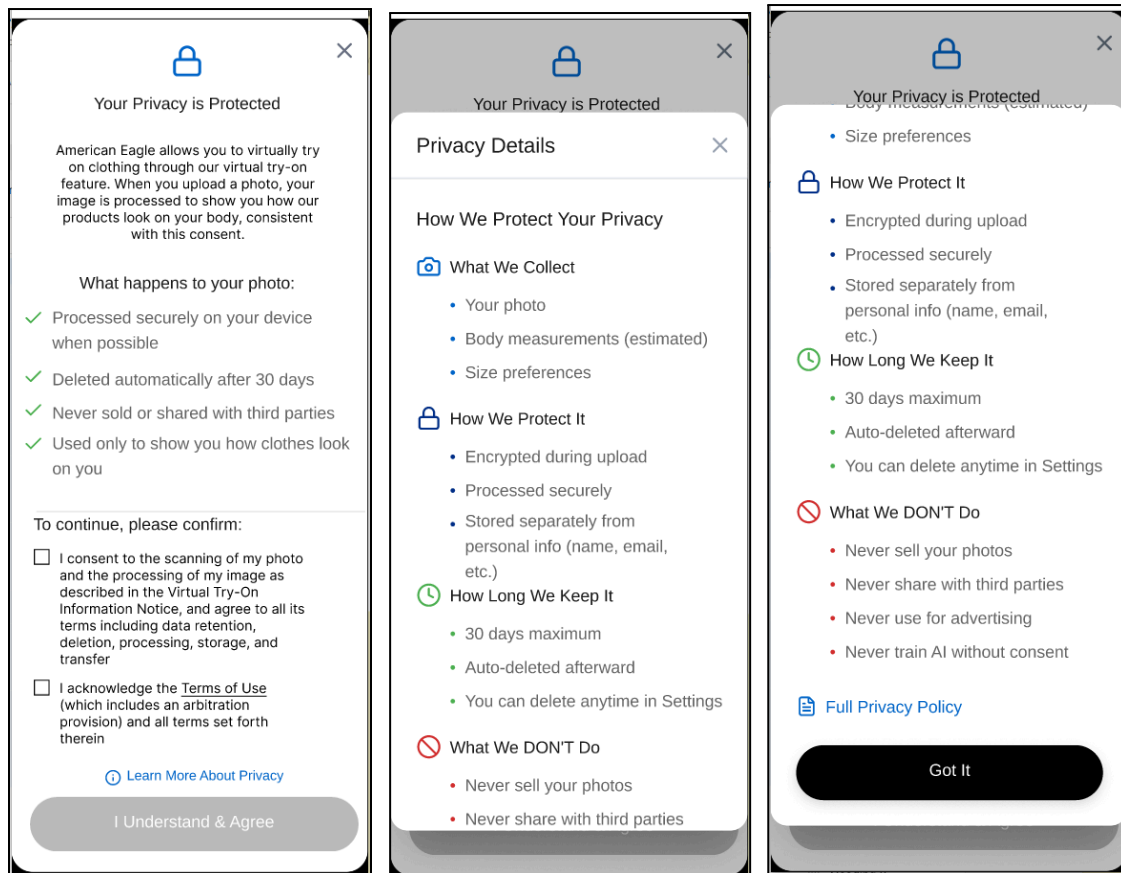

Changes made on AI Results

Changes 1: Enhanced Photo Guidelines

- Images are uploaded as reference and clarity
- Button checkmarks are clickable
- Frame is resized and scrollable

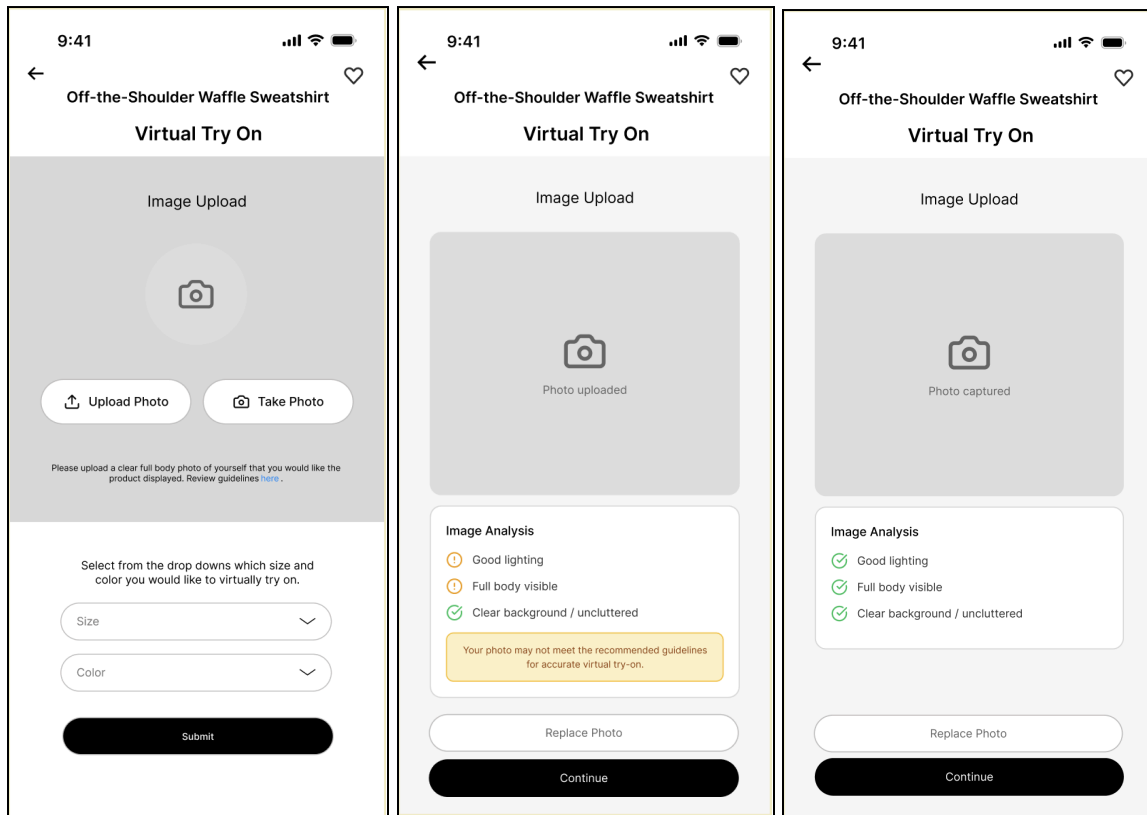

Changes 2: Enhanced Privacy Consent

- The content of the consent page is edited
- Link, checkmarks and button are clickable
- The frame has been resized and scrollable

The “Full Privacy Policy” link is designed to open a PDF file containing the complete policy when clicked.

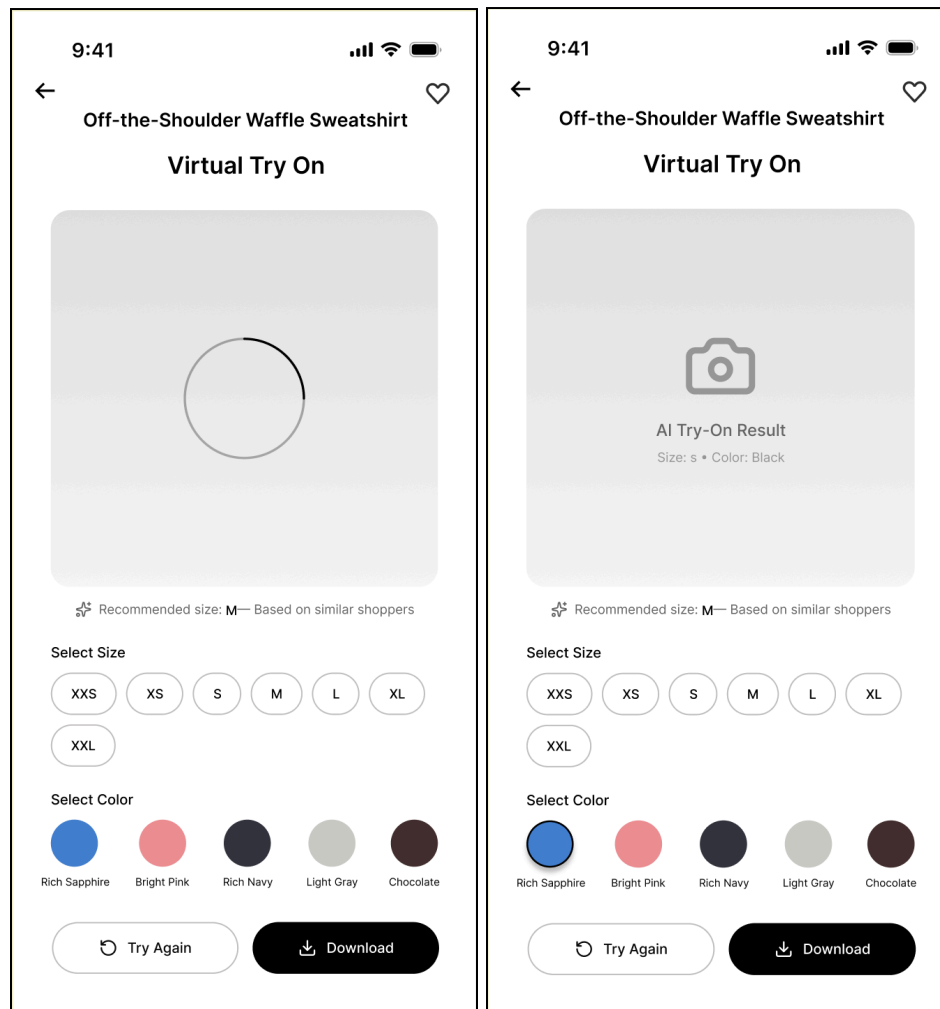

Changes 3: Redesign Virtual Try-On Upload Photo

- Buttons and link are now clickable
- Added "Continue" and "Submit" button
- Changed the color background of the frame
- Resized the frame

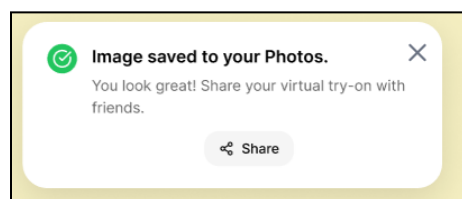

There are two Image Upload pages to show example scenarios with the image analysis.

Changes 4: Updated Virtual Try-On Result Page

- Changed the selection color that matches with main page color selection
- Each size, color selection and buttons are clickable
- A loading animation to stimulate a delayed page load

The image area is intentionally left blank as an example of the intended design. Generating or displaying an actual try-on image is outside our current capabilities.

- A notification shows up when user click on the "Download" button

Part 3

Part 3: Re-evaluation of Project 2

User Recruitment

Participant 1: Roommate, potential user, fits target demographic

Participant 2: Friend, familiar with virtual try-on systems and tech feasibility

Participant 3: Co-worker, college student, potential user

Interviews

Stage 1: Thematizing

Research Goals: to understand user perceptions, identify usability issues, and gather feedback on the previous project prototype

Method: semi-structured interview with estimate of 30 minutes per participant

Setting: quite private room with laptop for prototype interaction

Materials:

1. High-fidelity Figma prototype
2. Pre-written interview questions
3. Audio recording
4. SUS questionnaire

Stage 2: Designing Research Protocol

Introduction Script:

Hello, we just wanted to thank you for taking the time to complete this interview with us today. We want to let you know that all of your information will be confidential and anonymous. Before we get into things we also want to confirm that it is okay that this interview is audio recorded for the intent of gathering notes and reviewing accurate information given from you after. If at any point you wish to leave the interview you may and feel free to ask any questions along the process. To brief you on the topic at hand before we jump right into it, today we are hoping to understand your experience with our high-fidelity design on Figma.

Interview Questions:

1. Can you walk me through what you expect to happen when you click the “Virtual Try On” button?
2. How easy or difficult was it for you to upload your image and choose a size and color? What, if anything, felt confusing or unclear?
3. Would this virtual try on experience help you feel more confident about choosing a size or purchasing this item? Why or why not?
4. If you could change one thing about this virtual try-on process, what would it be and why?
5. How comfortable do you feel uploading a full-body photo of yourself into a shopping app? What would make you feel more secure?

Conclusion Script:

That wraps up the questions we have today and we want to thank you for your time and valuable feedback. We are conducting these interviews in hopes of improving the user experience of the American Eagle shopping platform and exploring more potential ideas and improvements. If you have any questions, please feel free to ask and if you need to reach out to us for any reason you can contact us via email.

Stage 3: Interview

We conducted interviews one-by-one based on the designed guide and each session followed the designed protocol with flexibility for follow-up questions based on participants' responses.

Stage 4: Transcribing, Stage 5: Analyzing, Stage 6: Verifying, Stage 7: Reporting

(Under “P3 Participant 1, 2, 3 Interview”)

Observation study & Cognitive Walkthrough

Observation study (us watching the user interact with our model):

Participant 1:

- Make dots bigger for swiping
- Make "Add to Bag" pop-up disappear
- Was confident navigating throughout app
- Showed certainty when clicking every button
- Design allowed user to complete each task with ease

Participant 2:

- Participant showed certainty during the photo upload step
- Participant carefully read the photo guidelines screen, indicating the instructions were needed and useful.
- Participant smoothly completed the try-on flow
- Participant noted that the flow virtual try-on is an example design and understood the reality implementation of it

Participant 3:

- Smooth/fast process to get through to the try on section
- Participant nodded when reading the photo guidelines indicating understanding
- Walkthrough was quick and user was decisive showing ease of use in design

Cognitive Walkthrough (based on specific task given to user):

Subtask	Cognitive Walkthrough Q.1 Is the user on the right track and action inline with an existing "mental model"? Is the effect of the action the same as the user's goal?	Cognitive Walkthrough Q.2 Is the "action visible" (perceivable and operable)?	Cognitive Walkthrough Q.3 Is "recognition" of "correct action" readily present and visible in the task, by means of signifiers, labels, icons, communication, etc.?	Cognitive Walkthrough Q.4 Is "feedback" present and is the user "understanding the feedback" such as confirmations, errors, warnings, etc.?
Participant 1	Yes	Yes	Yes	Yes
Participant 2	Yes	Yes	Yes	Yes
Participant 3	Yes	Yes	Yes	Yes

Administer SUS:

Participant 1:

System Usability Scale Questionnaire		Strongly Disagree						Strongly Agree
1.	I think that I would like to use this product frequently.	1	2	3	4	5		
2.	I found the product unnecessarily complex.	1	2	3	4	5		
3.	I thought the product was easy to use.	1	2	3	4	5		
4.	I think that I would need the support of a technical person to be able to use this product.	1	2	3	4	5		
5.	I found the various functions in the product were well integrated.	1	2	3	4	5		
6.	I thought there was too much inconsistency in this product.	1	2	3	4	5		
7.	I imagine that most people would learn to use this product very quickly.	1	2	3	4	5		
8.	I found the product very awkward to use.	1	2	3	4	5		
9.	I felt very confident using the product.	1	2	3	4	5		
10.	I needed to learn a lot of things before I could get going with this product.	1	2	3	4	5		

Figure 4: SUS responses by participant 1

Participant 2:

System Usability Scale Questionnaire		Strongly Disagree						Strongly Agree
1.	I think that I would like to use this product frequently.	1	2	3	4	5		
2.	I found the product unnecessarily complex.	1	2	3	4	5		
3.	I thought the product was easy to use.	1	2	3	4	5		
4.	I think that I would need the support of a technical person to be able to use this product.	1	2	3	4	5		
5.	I found the various functions in the product were well integrated.	1	2	3	4	5		
6.	I thought there was too much inconsistency in this product.	1	2	3	4	5		
7.	I imagine that most people would learn to use this product very quickly.	1	2	3	4	5		
8.	I found the product very awkward to use.	1	2	3	4	5		
9.	I felt very confident using the product.	1	2	3	4	5		
10.	I needed to learn a lot of things before I could get going with this product.	1	2	3	4	5		

Figure 5: SUS responses by participant 2

Participant 1 SUS score = 92.5/100, reflecting exceptionally high user satisfaction.

Participant 2 SUS score = 84/100, which is an excellent usability meaning the system is highly usable, efficient and intuitive with minor improvements needed in consistency and clarity.

Participant 3:

The System Usability Scale Standard Version		Strongly Disagree						Strongly Agree
		1	2	3	4	5		
1	I think that I would like to use this system frequently.	☐	☐	☒	☐	☐		
2	I found the system unnecessarily complex.	☒	☐	☐	☐	☐		
3	I thought the system was easy to use.	☐	☐	☐	☐	☒

Figure 6: SUS responses by participant 3

Participant 3 SUS score = 87.5/100, showing high user satisfaction.

Objective analysis and review of project 2 using: UX Heuristics + 13 Principles of Display Design

Nielsen's 10 Usability Heuristics:

1. Visibility of system status:
 - Loading circle on Pages 6-9 show that AI Virtual Try-On is processing
 - “Added to Bag” confirmation on Page 1
 - “Image uploaded” and “Photo captured” help users know system has their photo
2. Match between system and the real world:
 - Uses familiar shopping language: size, color, add to bag, virtual try-on. These all match real e-commerce mental models.
 - Color and size options are standard patterns that map well to already established ways that people shop for clothes.
3. User control and freedom:
 - Back arrow in the top left is consistently available to exit the try-on flow.
 - “Try Again” at the bottom of the result screen supports quick re-attempts.
4. Consistency and standards:
 - Visual consistency is strong: same top bar, typography, and background across all pages.
 - Button styles (primary black button, rounded rectangles for sizes and colors) appear consistent from screen to screen.
 - The virtual try-on layout (photo area on top, controls below) is repeated across screens, so the structure feels predictable.
5. Error prevention:
 - The photo guidelines and image analysis panel are ways to prevent bad results before they happen.
 - Separate steps for selecting size and color before submitting help users avoid mistakes.
6. Recognition rather than recall:
 - Users can see current size and color selections and swatches directly under the photo, so there's no need to remember what they chose earlier.
 - The product image and name stay consistent at the top of every screen, making sure the user is reminded of the original product.
7. Flexibility and efficiency of use:
 - Size and color swatches let users change options quickly without opening separate pages or dialogs.

- “Download” button on the result screen provides a shortcut for users who want to quickly save their try-on result image.
8. Aesthetic and minimalist design:
- Clean, minimalist layout with lots of whitespace and neutral color palette keeps the focus on the product and try-on result.
 - The information hierarchy is clear: large product/try-on image first, options underneath, actions at the very bottom.
9. Help users recognize, diagnose, and recover from errors:
- Image analysis panel is a good foundation for helping users understand what’s wrong with their photos (poor lighting, busy background)
 - “Try Again” gives a clear recovery path when the result isn’t satisfactory.
10. Help and documentation:
- The photo guidelines card is lightweight documentation. It tells users exactly how to take a good photo and what to avoid.
 - The privacy/detail overlays help build trust by explaining where the photo goes and how it’s used.

13 Principles of Design Display:

1. Make display legible/audible:
 - Resizing the frames and making them scrollable improves text legibility, especially on smaller screens.
 - Clearer consent wording and simplified guideline explanations enhance readability.
 - Clickable buttons and checkmarks provide visible feedback, making interactions easier to perceive.
 - The loading animation offers a clear, noticeable indicator that the system is processing.
2. Avoid absolute judgment limits:
 - Color selections, size options, and checkmarks are now distinct and clickable, reducing reliance on users making fine perceptual distinctions.
 - Background color changes on the upload frame help visually separate interface sections so users don’t rely on memorizing subtle differences.
 - The try-on result page uses consistent highlight colors for state changes, preventing users from having to guess meaning from single cues.
3. Top-down processing
 - Revised wording on the privacy consent page supports user expectations for transparency and clarity.
 - The “Continue” and “Submit” buttons follow typical user flow patterns, reinforcing what users already expect from form-based screens.

- Instructions and examples on the photo upload screens align with users' mental models of how virtual try-on tools typically work.

4. Redundancy gain

- Clickable elements can provide multiple things such as color change, labels, and interactive states reinforcing their purpose.
- The "Full Privacy Policy" is both a labeled link and also opens a PDF, providing information through different formats.
- Example images on the upload pages visually reinforce what correct input looks like alongside written instructions.

5. Discriminability. Similarity causes confusion: use discriminable elements:

- Updated color selections on the result page improve contrast between selected vs. unselected states.
- The redesigned background for the upload frame visually separates it from the rest of the screen, reducing confusion about where users interact.
- Buttons such as "Continue," "Submit," and "Download" have distinct shapes and placements, preventing accidental clicks.

6. Principle of pictorial realism

- The example image upload screens reflect how user photos will actually appear in the tool, creating a realistic preview of system behavior.
- Layouts and icon placements visually match the real-world actions (e.g., uploading a photo, viewing a try-on result).
- The image area on the result page is intentionally left blank to demonstrate where realistic future try-on images would appear.

7. Principle of moving part

- The loading animation demonstrates system progress in a way which eases users that their screen is simply not frozen.
- Scrollable frames show movement that corresponds with navigating long content (privacy policy, instructions, images).

8. Minimizing information access cost

- Scrollable frames keep information in a single window without forcing users to switch pages unnecessarily.
- Adding "Continue" and "Submit" buttons reduces searching because the next steps are explicitly presented.
- Clickable checkmarks and buttons reduce cognitive effort by keeping actions directly adjacent to their labels.
- The downloadable PDF is directly linked, removing extra navigation steps.

9. Proximity compatibility principle

- Related elements (e.g., size options, color selections, action buttons) are grouped tightly on the result page, supporting easy comparison.
- Instructions and images on the upload screens are placed close together to maintain contextual understanding.
- Consent text, checkmarks, and the action button are grouped to emphasize their relationship.

10. Principle of multiple resources

- The design combines visual cues (color, layout, images) with text instructions to distribute user processing across multiple resources.
- Animated indicators help users rely on motion perception rather than only text-based understanding.
- Example images help communicate expected user behavior without relying solely on written descriptions.

11. Replace memory with visual information: knowledge in the world

- Example image-upload scenarios show users exactly what is expected, reducing reliance on memory.
- Highlighted selection states (color, size, checkmarks) display the user's current choices visually instead of requiring recall.
- Consistent placement of navigation buttons ensures users don't have to remember where actions are located from screen to screen.

12. Principle of predictive aiding

- The loading animation gives users a clear expectation that processing time is normal.
- The upload guidelines and example images help users anticipate how their photo will be used in the virtual try-on.
- Notifications triggered when clicking the "Download" button confirm that an outcome is happening, supporting user expectations.

13. Principle of consistency

- Interactive elements (buttons, checkmarks, link styles) behave consistently across all screens.
- The main theme color is used throughout selections to reinforce visual unity.
- The structure of instruction->action->confirmation is consistent across the guidelines page, consent page, upload pages, and result page.
- Resized, scrollable frames appear in multiple sections, giving users predictable layout behavior.

Participant 1 Interview:

P3 Participant 1 Interview:

Shayla:

Um, can you walk me through what you expect to happen when you click the virtual try on button? Like if this were any app and you were to click on it, what would you expect to show up?

Interviewee:

I was thinking was gonna happen is that you might have like, a square with like a camera. Like a camera live and the sweater was gonna like appear on your body.

Shayla:

Oh, live. Okay. Yeah, that makes sense.

Interviewee:

But because I've seen other - I don't know if I've actually seen something like that. But I don't know, that's what I... that's what I imagined.

Shayla:

Yeah. Okay. The second question is how easy or difficult was it for you to upload your image and choose a size and color? What if anything felt confusing or unclear?

Interviewee:

I think it was pretty easy to upload the pictures. Yeah, because you basically had it like there, like the logos for something, like the upload, the square and the arrow and it's like something you see everywhere. So you already know whatever you see that I could, you're supposed to either upload or take a picture. Yeah. So that was like pretty straightforward. And also you have like the size and the color. So yeah, think that was easy. Yeah, the only thing is like, I wish that the size and color would actually show up, but we're not able to get it to do that.

Shayla:

Okay. Would this virtual trial and experience help you feel more confident about choosing a size or purchasing this item? Why or why not?

Interviewee:

Yeah. Because I don't know that way you can like, sometimes you see the color online whenever you see it in person, it's a completely different shade or it's not... the pictures of the models that they have online. It's not the same. The thing doesn't fit you exactly. And also like the fact that you can download the picture. So you can like try it on virtually, download the picture and in case you go to the store you already have like, "hey, so I'm looking for this." Like this size and this color. So you don't have to like go into the dressing room again. Right. So I like it.

Shayla:

If you could change one thing about this virtual trial process, what would it be and why? If anything?

Interviewee:

I'd like the button that instead of having to click twice the arrow to go back to the original page to actually purchase this sweater, then you could have like an extra button saying, oh yeah, I like the size and I like this color. I want to purchase it. I want this one.

Shayla:

Oh, like a purchase like on here or like just as just one that takes you straight back to the main page instead of going back twice. So that it's easier. Gotcha. Okay.

How comfortable do you feel uploading a full body photo of yourself into a shopping app? What would make you feel more secure? Cause like, I don't think I showed you, if you go here, it's really tiny, but this gives you like a do and don't of like what you should do for the picture. And then it gives you this like little, It's like a checklist. And then It gives you like an example. One of the rules is that you should wear form fitting clothes and not wear baggy clothes, because otherwise the AI might like get confused and not do an accurate picture. It's like, would you feel comfortable wearing like a bra and underwear or just like tight fitting clothes?

Interviewee:

Tight fitting clothes, yeah, but like taking a picture of me in underwear. Yeah, no.

Shayla:

Yeah. That's a... that's fair. It doesn't ask you to do that, but I was just thinking... Does that make sense? Like, would you be comfortable uploading a picture of you in like leggings and a tight shirt? Is there anything that would make you feel more secure?

Interviewee:

Um, like, I don't know. That's what you have to like, if you want the AI to actually put the clothes on you, like on your picture, that's what you have to do. Right. I cannot find any other solution.

Shayla:

Okay, cool. That wraps up the questions we have today. And we want to thank you for your time and valuable feedback. We are conducting these interviews in hopes of improving the user experience for shopping platforms and exploring more potential ideas and improvements. If you have any questions, please feel free to ask. And if you need to reach out to us for any reason, you can contact us via email.

Report/Findings:

The interviewee only had one recommendation, which was to make it so that the user could go back to the main page after receiving their AI Virtual Try-On result, instead of having to click the back arrow multiple times. Doing this would give the user quicker access to the “Add to Cart” button. This would also make the mental process simpler, resulting in higher user experience and satisfaction. All other aspects were satisfactory.

Participant 2 Interview:

P3 Participant 2 Interview:

1. What do you expect to happen when you click “Virtual Try-On”?

“When I click it, I expect it to take me into a guided flow probably starting with uploading a photo, then showing me instructions, maybe cropping, and finally placing the clothing on my body. Since the screen says ‘Virtual Try-On,’ I definitely expect to see myself wearing the sweatshirt at the end.”

2. How easy or difficult was the process of uploading your image, reading guidelines, and cropping your photo?

“The overall flow felt easy. The guidelines helped because without them I wouldn’t know what kind of pose or lighting the system needs. The only confusing part was I wasn’t always sure how much of my body needed to be included, so I had to readjust. But everything else was clear and straightforward.”

3. Does the virtual try-on help you feel more confident choosing a size or buying the item? Why?

“Yes, it does make me feel more confident. Seeing the sweatshirt on my own body shape helps me understand the length and fit better than just looking at product photos. It’s not perfectly realistic, but it gives enough of an idea to support my decision.”

4. If you could change one thing about the process, what would it be and why?

“I would like to add like the cropping instructions. Maybe add a dotted body outline, or tell me exactly where my head and feet should be in the frame. That would make the upload feel more precise. I’d also like a small indicator showing how long the photo is used or if it’s stored.”

5. How comfortable do you feel uploading a full-body photo of yourself? What would make you feel more secure?

“I’m somewhat comfortable but not completely. I’m definitely feel more secure than previously as there was a clear statement that my photo is not saved permanently, or that it’s deleted right after generating the try-on. A small privacy disclaimer would make a big difference.”

Report/Findings:

Participant 2’s expectation is heavily centered on a realistic overlay showing themselves wearing the item by the end of the experience. They described the workflow as easy and clear, noting that the guidelines were helpful but they were unsure how much of the body must be

included and that may be required readjustments. They suggested improvement on adding body outliner, markers or indicators for where head/feet should be.

Participant 3 Interview:

P3 Participant 3 Interview:

Kayla: Good afternoon! Thanks again for joining us today. Just as a quick reminder, everything you share will be confidential and anonymous, and we're recording this session so we can keep accurate notes. If you need to pause or step away at any time, totally feel free.

Today, we're hoping to understand your experience with the updated high-fidelity prototype especially since it now includes the improvements based on the first round of feedback..

Does that all sound okay?

Interviewee: Yep, that sounds good.

Kayla: To start off, can you walk me through what you expect to happen when you click the virtual try on button?

Interviewee: Um, yeah so now that I've used it once, I kind of expect the little step by step flow to open again. Like first the upload screen, then the guidelines with the examples, and then the cropping part with the new dotted outline. And then after that, I expect it to take me to the preview where it shows the sweater on me. I noticed the button is very clear and directing now so I know I am going into the process.

Kayla: Nice, so it aligned with what you thought it would be?

Interviewee: For sure.

Kayla: I want to understand how this process was for you, was it easy or difficult for you to upload your image and select any options? Was there any confusing aspects?

Interviewee: It was definitely smoother this time. The guidelines were cleaner, and that new little outline thing in the cropper helped a lot. Last time I wasn't sure how much of myself needed to be in frame, but now it basically tells me without words. And having the size and color update visually under the preview was super helpful. The only tiny thing... maybe make the outline glow or something? Just so it stands out a little more. But honestly, it was really easy.

Kayla: oKay, that's helpful. Good to hear the outline worked better.

Kayla: Do you feel like the virtual try on experience helps you feel more confident when selecting a size of buying an item?

Interviewee: Yes definitely.

Kayla: Can you tell me why?

Interviewee: Even with this example, the sweater would look more realistic on my picture. I know it is still AI but I at least have a better sense of how it might fall on my body and look on me. And I like that you added the disclaimer about the sizing being approximate. I felt as if it opened up some transparency.

Kayla: If you could tweak one thing about this updated version, what would it be?

Interviewee: I honestly cannot think of anything I would change right now it seems very simple.

Kayla: And for the last question I have for you today, how comfortable do you feel uploading a full body photo of yourself? Is there anything that would make you feel more secure?

Interviewee: Yeah, I actually felt more comfortable this time around. The privacy note under the upload button was reassuring and the part where it says the photo is processed temporarily and deleted after generating the try-on. Also, knowing my face doesn't need to be super clear makes me feel better. I could even cover my face with my phone for better privacy. The only thing I'd add is maybe a quick "Your photo has now been deleted" message after the preview loads. Like a confirmation.

Kayla: That's a really good suggestion thank you.

Report/Findings:

The participant noticed and appreciated all of the updates. They found the upload experience easier because of the visual guidelines and body outline, and the new privacy text increased their comfort with uploading photos. They also reported greater trust in the sizing due to the added transparency. The participant suggested a few additional improvements, including adding a glow or more contrast to the body outline, incorporating a loading or progress indicator during image generation, and providing a confirmation that the uploaded photo has been deleted.
